

8.3.2. Design and Development Planning

The organization has to plan the design and development process in order to determine the stages of this process as well as the controls needed.

- ✓ How long will it take to survey / what surveying skills are needed?
- ✓ Who should review the design? Who can confirm it is right?
- ✓ What needs to be done to check if it is right?
- ✓ Who would be responsible?
- ✓ Resources needed and any subcontractors
- ✓ Ensuring all involved communicate (e.g. surveyor and designer and administrator)
- ✓ Checking that what you are designing is what the customer wants
- ✓ What other things are needed – products and services?
- ✓ Control needed to ensure it goes to plan, from customers and interested parties (subcontractors / manufacturers / monitoring stations)
- ✓ Documenting that the above has been considered

Auditing

- ✓ What is the overall flow of the design planning?
- ✓ How is it described?
- ✓ What resources and competencies are required?
- ✓ What part of the design will be outsourced?
- ✓ Who is responsible and are the authorities defined?
- ✓ How are (internal and external) interfaces between various groups identified and managed?
- ✓ Are the required verification, validation and review points defined?
- ✓ Are the main milestones and timelines identified?
- ✓ Is the implementation and effectiveness of the plan monitored?
- ✓ Is the plan updated and communicated to all relevant functions as necessary?
